

SonicWALL Complete Anti-Virus

SonicWALL Security Applications

SONICWALL

While most organizations have some type of virus protection in place for their network, IT professionals continue to search for more comprehensive solutions to protect against rapid virus outbreaks on their desktop machines, as well as their file, print and mail servers. Developed in partnership with McAfee, SonicWALL Complete Anti-Virus combines the enforced desktop protection offered by our patent-pending Network Anti-Virus product with comprehensive server protection offered by our new Server Anti-Virus upgrade. SonicWALL Server Anti-Virus incorporates the award-winning McAfee NetShield and GroupShield applications for Windows-based File, Print and Exchange servers.

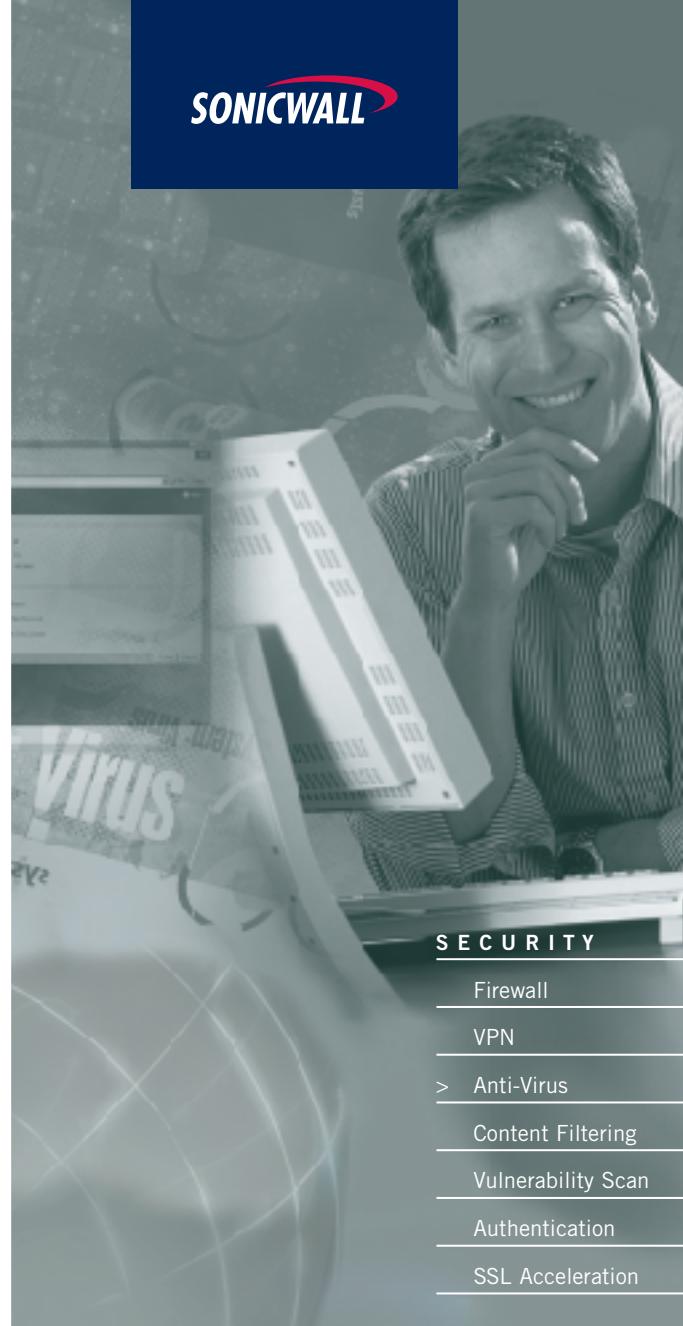

SonicWALL Complete Anti-Virus provides organizations with a highly automated and enforced solution for the desktop, eliminating machine-by-machine anti-virus deployment, reducing the costs associated with administering an anti-virus policy throughout an entire network, and delivering fast time-to-response during rapid virus outbreaks. SonicWALL's patent-pending technology is the only zero-administration solution that automatically manages all aspects of desktop virus protection, including client auto-installation, virus definition updates and anti-virus policy enforcement at the Internet Gateway.

SonicWALL Complete Anti-Virus also provides administrators with the flexibility and manageability to meet the highly specific anti-virus requirements of their network servers.

Complete Anti-Virus includes McAfee NetShield for Windows—which detects virus-infected files transmitted to and from file and print servers—and McAfee GroupShield for Exchange, which applies the power of the award-winning McAfee Virus Scan engine to Microsoft Exchange.

Complete Anti-Virus is ideal for organizations in search of a comprehensive anti-virus solution that provides automatic enforcement to desktops while also giving administrators flexibility and control over managing the protection of their servers. And customers who already have SonicWALL's industry-leading Network Anti-Virus can easily upgrade to Complete Anti-Virus by purchasing the SonicWALL Server Anti-Virus upgrade.

All elements of SonicWALL Complete Anti-Virus share a common engine and signature file, are compatible with SonicWALL's entire family of Internet security appliances, and are available as one- or two-year subscriptions.

- *Client Anti-Virus Auto Update and Enforcement*
- *Rapid E-mail Attachment Blocking*
- *Flexible Server Management*

SonicWALL Complete Anti-Virus Features and Benefits

The Complete Anti-Virus Solution for Clients and Servers

- **Automated Client Enforcement, Zero Administration.**

SonicWALL Complete Anti-Virus verifies that every Windows-based PC accessing the network has the most up-to-date version of anti-virus software installed and active, especially before rapid virus outbreaks. It guards the gateway for virus update alerts while handling all client enforcement and management. Rapid e-mail attachment blocking prevents new viruses from spreading by intelligently blocking infected e-mail file attachments from the Internet—even before the virus signature is available. Automation and enforcement of network clients eliminates the substantial costs commonly associated with other centralized virus management solutions by releasing IT staff from desktop anti-virus policy management tasks.

- **Powerful Server Central Management Console.**

SonicWALL Complete Anti-Virus' NetShield for Windows uses advanced heuristic technologies to seek out previously undiscovered viruses, removing malicious code with enterprise-level manageability. A powerful central management console provides complete control over all Windows servers from any NT server or workstation. Administrators can customize settings on each individual server, or simply duplicate existing configurations and deploy them across the network. And NetShield's powerful AlertManager feature allows IT professionals to selectively define, prioritize, activate and enable any combination of system alerts.

- **Seamless Integration with Microsoft Exchange.**

SonicWALL Complete Anti-Virus also includes McAfee GroupShield for Exchange 5.5 and 2000, with Microsoft Management Console integration that enables administrators to manage their Exchange servers and anti-virus configurations from the same console. GroupShield's Outbreak Manager provides proactive defense against the infestation of new viruses by looking for suspicious "outbreaks" such as unusual e-mail behavioral patterns. Content filtering, intelligent scanning, and detailed logging and reporting help ensure that all Exchange servers in the network remain virus-free.
